# Alexander Bratyshkin 260684228

# Assignment 2

# Q1)

- 1) flag[0] = F, flag[1] = F;
- 2) P0 executes => flag[0] = T, flag[1] = F;
- 3) CPU switch from P0 to P1 before P0 reaches while loop => P1 executes => flag[0] = T, flag[1] = T;
- 4) P0 goes inside while loop => flag[0] = T, flag[1] = T;
- 5) P1 goes inside while loop => flag[0] = T, flag[1] = T;
- 6) P0 & P1 stuck at while loop => *deadlock*.

#### **Q2)**

No deadlock is possible for this question. However, there is indeed process starvation:

- 1) turn = 0;
- 2) P0 executes => turn = 0;
- 3) P0 goes into CS because it satisfies while loop's condition => finishes CS => turn = 1. In the meantime, P1 waits in its while loop;
- 4) After P0 is done with its CS, P1 enters while loop because turn = 1;
- 5) P1 finishes executing, sets turn = 0;
- 6) P0 continues in non-critical section, turn = 0. In the meantime, P1 loops back, and is now waiting forever because turn = 0. Therefore, starvation of P1 occurs.

Another possible scenario for starvation is the following:

- 1) turn = 0;
- 2) P0 executes, goes through to the CS past the while loop (turn = 0). In the meantime, P1 is waiting to enter its critical section (busy waiting on while loop);
- 3) P0 crashes during execution of CS, does not set its turn to 1, and therefore P1 remains waiting to go past while loop.

## Trace of output when running ./a.out test1 and ./a.out test2 simultaneously

#### test1

```
[alex@alexbrat assignment_2]$ ./a.out test1
